

11010170 Prolog Assignment 2

Question 1

Write a predicate 'jumble(List1, List2, JumbledList)' which takes three lists as arguments and returns a third list as follows:

?-jumble([a, b, c], [1,2,3], X).

X = [a, 1, b, 2, c, 3]

Solution

```
1  /*When the lists are of different sizes, these two statements take care of the case*/
2  jumble([X|L1],[],[X|L1]).
3  jumble([], [Y|L2],[Y|L2]).
4
5  /*When the lists have one each elements, the resultant list has the two elements clubbed together*/
6  jumble([X],[Y],[X,Y]).
7
8  /*Calls the jumble function with the remainder of the lists after clubbing the first elements of the lists*/
9  jumble([X|L1],[Y|L2],[X,Y|L3]):-jumble(L1,L2,L3),!.
10
11 /*When both the lists are empty, the output list is also empty*/
12 jumble([],[],[]).
```

Execution

```
?- jumble([a,b,c],[1,2,3],X).
X = [a, 1, b, 2, c, 3].

?- jumble([a,b,c],[1,2,3,4],X).
X = [a, 1, b, 2, c, 3, 4].

?- jumble([a,b,c,d,e],[1,2,3],X).
X = [a, 1, b, 2, c, 3, d, e].

?- jumble([],[],X).
X = [].

?- 
```

Question 2

Write a predicate 'split(Numbers, Positives, Negatives)' which splits a list of numbers into two lists: positive ones (including zero) and negative ones. For example:

?-split([2, -1, 0, 7, -8], X, Y).

X = [2, 0, 7]

Y = [-1, -2]

Solution

(Without using cut)

```
1  /*When the list is empty, the resultant list is empty as well*/
2  split([],[],[]).
3
4  /*When the first element is positive or zero, it is prepended to the first output list */
5  /*and the remaining of the resultant list is obtained recursively from the remainder of the list*/
6  split([X|L],[X|L1],L2):-X>=0,split(L,L1,L2).
7
8  /*When the first element is negative, it is prepended to the second output list and the remaining */
9  /*of the resultant list is obtained recursively from the remainder of the list*/
10 split([X|L],L1,[X|L2]):-X<0,split(L,L1,L2).
```

(Using cut)

```
1  /*When the list is empty, the resultant list is empty as well*/
2  split([],[],[]).
3
4  /*When the first element is positive or zero, it is prepended to the first output list */
5  /*and the remaining of the resultant list is obtained recursively from the remainder of the list*/
6  /*The cut is used because, if the condition is true, the X need not be checked for the <0 condition as it is already >=0*/
7  split([X|L],[X|L1],L2):-X>=0,split(L,L1,L2),!.
8
9  /*When the first element is negative, it is prepended to the second output list */
10 /*and the remaining of the resultant list is obtained recursively from the remainder of the list*/
11 split([X|L],L1,[X|L2]):-X<0,split(L,L1,L2).
```

Execution

(Without using cut)

```
?- split([2,-1,0,7,-8],X,Y).
X = [2, 0, 7],
Y = [-1, -2]
```

(Using cut)

```
?- split([2,-1,0,7,-8],X,Y).
X = [2, 0, 7],
Y = [-1, -2].

?- 
```

Question 3

Write a predicate `nu` (for not unifiable) which takes two terms as arguments and succeeds if the two terms do not unify.

- (a) Write it with the help of `=` and `\+`.
- (b) Write it using cut-fail combination and don't use `=` and `\+`.

Solution

(Without using cut-fail) Part a

```
1 /*The boolean value of comparison of X and Y values are evaluated and negated*/
2 nu(X,Y):- \+ X=Y.
```

(Using cut-fail) Part b

```
1 /*When the elements are the same, it prevents backtracking by using cut and the fail statement makes it return false*/
2 nu(X,X) :- !,fail.
3
4 /*When the control reaches here, the wildcard entries are different here and the cut */
5 /*prevents backtracking to the first statement and it returns true*/
6 nu(_,_) :- !.
```

Execution

```
?- nu(joe,joe).
false.

?- nu(joe,X).
false.

?- nu(joe,foe).
true.

?-
```

(Without using cut-fail) Part a

```
?- nu(joe,joe).
false.

?- nu(joe,X).
false.

?- nu(joe,foe).
true.

?-
```

(Using cut-fail) Part b
